YELAGO, L.F.

У<sub>Г</sub>Г<sub>Р</sub>Д

Application of hexachloran against May-beetle larvae.  
L. F. El'yan. Trudy Botan. Sida, Akad. Nauk Ukr. S.S.R.  
2, 167-72 (1953). Referat Zhur. Khim. 1954, No. 2143, 2.  
For May-beetle larvae the most toxic insecticides are technically pure hexachloran (BHC) and NaSIP<sub>4</sub> (100% mortality within 10 days after treatment); 12% BHC dust is less effective (100% mortality within 30 days); DDT is less toxic than 12% BHC dust. The toxic effect of BHC against the larvae is higher when it is mixed with the soil rather than sprayed on the hop stalks or when it is worked into the furrow made around the stalks. Spraying the stalks with BHC retard the plant growth and in some instances may kill the plants. BHC is more effective used on loamy soils than on sandy loam soils and decreases the sprout formation and yield of hops when it is in direct contact with nude-ground organs of the plants. On the contrary BHC placed in furrows around the stalks stimulates the hop growth. The application of BHC in furrows for the protection of hops against larvae of May-beetle is recommended 15-20 kg./ha. for the plantations and 15 kg./ha. for the experimental fields.

Inst : Botanical Garden, AS USSR

Title : Pests and Diseases of Citrus Plants in the Ukraine  
and Their Control

Orig Pub : Tr. Botan. sada. AN USSR, 1957, 4, 120-125

Abstract : The most dangerous pests are the red citrus mite and Tetranychus sp., soft lecanid and citrus lecanid, green peach louse and acacia aphid and the long-tailed mealybug and "primorskiy" mealybug. The most effective control consists of spraying (usually once) with a 1% - 1.5% (according to preparation) emulsion of DDT against lecanids, mites, and aphids; using of the preparation NIULF-100 (dust, 1% suspension, 0.03% - 0.05% emulsion according to preparation) against mites and aphids; and

introducing into the soil of 25 kg/ha of hexachlor-  
acyclohexane before or during the preparation for  
autumn planting (per active substance) against the pests  
living in the soil. Control of diseases: by "gomose"  
- disinfection of the cleaned sick spots with a solution  
of blue vitriol and subsequent smearing with Bordeaux  
paste; dusting of the plants and surfaces of the soil  
in the trenches with the preparation AB against molds;  
disinfection of their nests with a 3% solution of blue  
vitriol or 2% - 3% Bordeaux mixture and formalin. --

Editor-in-Chief M.E. Shabotov Executive Ed. A.I. Galperin Ref. No. I.M.  
General Topic

PURPOSE This book is intended for members of scientific research organizations, engineers and scientists concerned with problems of geophysical prospecting and research in industrial applications.

CONTENTS This is a collection of 12 articles by different authors on new methods of interpretation data and evaluation seismic wave velocity. The theory of seismic interpretation is discussed. The methods of calculating first particle directions through seismic waves are described. The theoretical interpretation of some electrical memory metal devices by the method of polarization is given. Statistical methods of geophysical methods of investigation (geophysical, geoelectric, georadar, etc.) are described. New methods for determining coal beds by seismic methods are described. As a new method for determining coal beds by seismic methods is proposed. Most of the methods are also described. The purposes are discussed by references, a majority of which are English.

TABLE OF CONTENTS:

738. (186) A NEW METHOD OF TREATMENT OF INFECTED FRACTURES OF THE LONG BONES (Russian text) - Elanskiy N. N. - VOEN.-MED. ZH. 1956, 12 (3-10)

The basic idea of the method is the necessity for intra-osseous immobilization of the fragments by means of a metallic nail-cum-cannula, through which the fracture site and the wound cavity can be irrigated with antibiotics in solution. Osteomyelitis developing after open ununited fractures is not a contraindication to fixation of the fragments with the hollow nail after removal of sequestra and loose bone fragments. This method, with irrigation with a solution of penicillin and novocaine, can be used successfully in ununited fractures, delayed union and pseudarthroses. Contraindications to the use of the method are: shock, sepsis, anaerobic infection and severe comminution of the bone fragments.

TITLE:

The Development of Military Field Surgery for 40 Years

PERIODICAL:

Voyenno-meditsinskiy zhurnal, 1958, Nr 2, pp 19 - 31 (USSR)

ABSTRACT:

The article deals with developments in the military field in surgery in the 40 years since the revolution, concentrating particularly on the inter-war years and the contrast between military-medical practices in the two world wars. The author dwells first on characteristics of first world war field surgery, presenting a sorry picture. He says that operations in the field were performed rarely (cites surgeon V.A. Oppel'). Operations in division dressing units were performed in 0.6 - 3.3% of cases, in division hospitals in 1.0 - 5.4% of cases, and in mobile field hospitals in 13.3 - 30.8% of cases. The "evacuation system" prevailed rather than on the spot surgery, resulting, he maintains, in a higher death rate than necessary. He contrasts the greatly increased use of surgery in the Red Army. Methods of surgical treatment of the wounded for use in the field close to the front,

**The Development of Military Field Surgery for 40 Years**

largely based on French experience in World War I are discussed. He dwells on the use of two sutures. The system of organization of medical and surgical aid in the Soviet Army adapted towards World War II - "stage treatment with evacuation on prescription" - is described and discussed. The use of immediate surgery is stressed. The author relates the development of specialized field units for treatment of specific types of wounds, e.g. head, chest, and abdominal wounds, in the first year of World War II. He dwells on treatment of head wounds, and points out that early and thorough surgical treatment greatly lowered the post-operative death rate. The treatment of chest wounds is discussed at some length, as is the treatment of wounds to the abdominal cavity. He states that the occurrence of tetanus in WW II was rare, only .1 - .5 per 1000 wounded had it, while in WW I it occurred in up to 1.2% of cases. Anaerobic infection was noted in 0.4 - 1.2% of cases in WW II, while in WW I it occurred in from 5 - 13%, and sometimes as many as 18% of cases in various armies. The author briefly describes the use of X-ray and fluoroscopic equipment in field hospital units, the transfusion and blood service, and air

transport of wounded in the Soviet Army. He refers to a 35 volume compilation of "The Experience of Soviet Medicine in the Great Fatherland War, 1941 - 1945". Postwar developments in military field surgery are reviewed, and in concluding, the author mentions some of the problems remaining to be dealt with by military field surgery, particularly in the light of contemporary methods of waging war. The following persons are mentioned in the text: B.K. Leonardov, I.S. Kolesnikov. There are 3 Soviet references.
